

A FILE VERSIONING AND RECOVERY SYSTEM

TEAM MEMBERS:

Name: P Neeharika(2520090233)

Name: S Chakrika(2520090044)

Name: G Shivani(2520090046)

PROBLEM STATEMENT

- Files are frequently modified and updated.
- When a file is overwritten, the previous version may be lost.
- Accidental changes or deletion can result in loss of important data.
- Managing multiple copies manually can become confusing.
- There is a need for a simple system to track, manage, compare, and recover file versions.

PROPOSED SOLUTION

The system maintains a user-defined number of previous versions instead of overwriting the previous versionThe system allows users to:

- Create new file versions
- View version history
- View version details
- Compare different versions
- Restore an earlier version
- Maintain organized file history

ABSTRACT

The project “A File Versioning and Recovery System” is designed to develop a simple and organized system for managing different versions of files. The main concept of the project is to maintain a history of a file as it is created and modified. Instead of replacing the previous version whenever a file is updated, the system stores the new version separately along with relevant details such as the version number, file name, and date and time of modification. This allows users to view and manage the different versions of a file through a structured version history.

The system provides features for creating new versions, viewing available versions, and maintaining the stored file history. Users can select a particular version and view its details, making it easier to keep track of changes made to a file over time. The system can also support comparison between different versions, allowing users to identify the changes made between them. These features are implemented through a simple and easy-to-use interface.

Another important part of the project is the recovery mechanism, which allows users to restore an earlier version of a file when required. If a user makes unwanted changes, replaces a file, or accidentally deletes it, an available previous version can be selected and restored. The project therefore combines version tracking and file recovery into a single system. It focuses on concepts such as file handling, data storage, version management, file comparison, and recovery mechanisms. Overall, the project provides a practical implementation of version control concepts in a general file management environment and demonstrates how files and their different versions can be stored, accessed, managed, and restored.

To control storage usage, the system allows the user to specify the maximum number of versions to retain. When the limit is reached, the oldest version is automatically removed when a new version is created.

WORKING METHODOLOGY

WORKING METHODOLOGY

SYSTEM ARCHITECTURE

KEY FEATURES

1

Version Creation and history

- Creates a new version whenever a file is modified.
- Displays the available versions of a file.

2

Organized Storage

- Maintains files and their version information systematically.

3

File Recovery

- Allows users to restore an earlier version.

4

Version Limit Management

Allows users to set the maximum number of versions to retain and automatically removes the oldest version when the limit is exceeded.

TECHNOLOGIES USED

Component	Technology
Frontend	HTML, CSS, JavaScript
Backend	Java
Database	MySQL
File Storage	Local File Storage
IDE	Visual Studio Code / IntelliJ IDEA
Database Tool	MySQL Workbench

CONCLUSION

The File Versioning and Recovery System provides a simple and organized way to manage different versions of files. Instead of replacing the previous version, the system keeps a history of changes, making it easier to track and manage files.

The system also allows users to view, compare, and restore previous versions when required. Overall, the project demonstrates how file handling, database storage, version management, and recovery can be combined into one practical system. The user-defined version limit also helps control storage usage by automatically removing the oldest version when the maximum limit is reached.

THANK YOU!
